Swamp Puzzles
Level 3

Copyright © 2022 by Mathitude.com

It looks like our friend the crab is back one more time.

1

Each pillar's height is calculated by adding, subtracting, multiplying, or dividing the corner numbers.

2

Each pillar is taller than the one before it.

3 
All of the pillar heights before the final pillar add to the final pillar height.

4

You move left and right, or up and down, but never diagonally. You use all the pillars.

With Level 3 swamps, some of the pillars have 4 corner numbers.

When a pillar has 4 corner numbers, you'll use 3 operations to find its height, starting with the upper left number and continuing clockwise, ending with the lower left number. Some operations might be the same. I'll show you how on the next page.

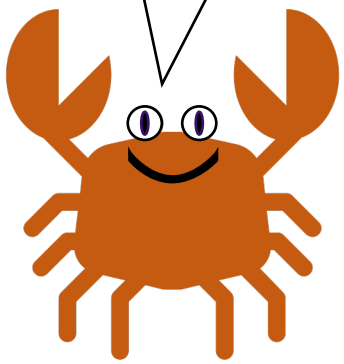
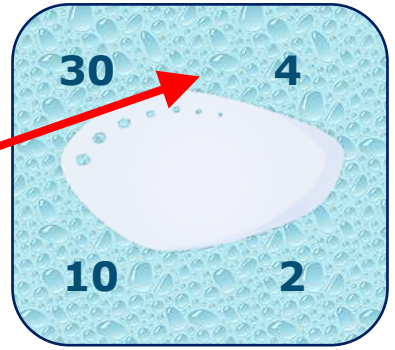
Let's say we've already found that the height for this pillar must be between 56 and 62.

The options for the first operation are in the red box. Let's explore what happens if we use the result that is closest to our target range, 34.

The result of each operation will always be a whole number greater than 0.



30 + 4 = 34
30 – 4 = 26
30 x 4 = 120
~~30 ÷ 4 = 7.5~~



34 x 2 = 68, which is even closer to our target range. And 68 – 10 = 58, which is greater than 56 and less than 62. Since there's only one correct answer, we've found it!
